

Character Array

In case of character array, automatically '\0' (null) is stored at the last index of the array because last element of the character array is not fixed.

Structure

Structure is a special kind of variable which can hold all kinds of value within it that means structure type of variable can hold integer type, float type, character type as well as all kinds of array of types value.

Structure is a 2D matrix which can hold all kinds of value.

"struct" is a key word which is used to declare structure type of variable. Basically it is a global variable which is used within the main function or within all the function. To access the data member of a structure "." operator is used. We have to define structure variable as an array.
